# Document Automation

## Document and workflow automation

Our commitment to creating an efficient workplace starts with tools that allow our lawyers to leverage prior work product. We build document assembly products to generate first drafts of legal documents through a simple questionnaire. Instead of re-inventing the wheel, the algorithm in the tool uses weak artificial intelligence automation to create a legal document from agreed-upon model clauses, limiting human error and increasing efficiency across a wide range of legal practice areas.

Further, we use modern platforms like our own NCode Decision System to build new types of legal products for our clients. As part of our innovation strategy and through a process of rapid prototyping and iterative design, we can build custom tools to meet client requirements, such as automating business processes for in-house legal teams and other departments.

### Key benefits

#### Increased efficiency

By building automated tools and document assembly products, we are able to help client in-house legal teams focus on legal work that matters and delegate and automate mundane processes.

#### Quality control

By building tools to an exact set of requirements and controls, even if in-house legal teams delegate the management of processes or generation of documents to other non-legal teams, quality legal work is ensured.

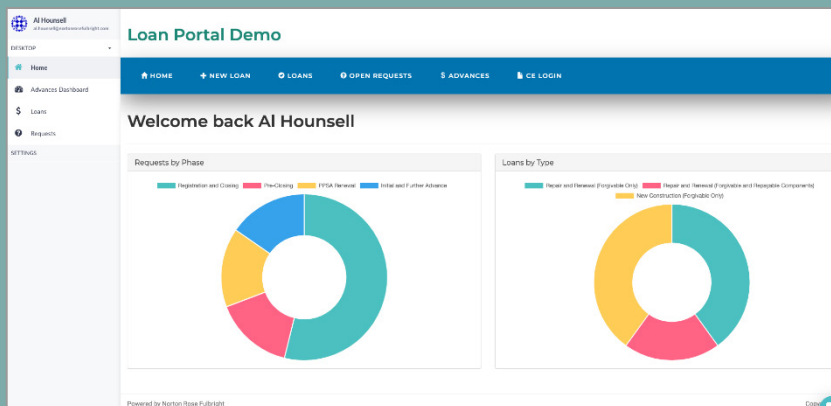

#### Increased ease of use

Legal process automation tools take old, legacy products and bring them into the present with clean user interfaces and simplified workflows.

## Our process

By answering questions on a simple questionnaire, a user can generate the first draft of a high-quality, vetted legal document. We then can integrate this questionnaire into a client's existing system and/or workflow to store the structured data entered and move generated contracts to the next stage of the contract lifecycle such as negotiation or execution through DocuSign.

The screenshot shows a web application interface for generating legal documents. The interface includes a navigation menu with 'Analytics', 'Documents', 'Tasks', 'Templates', 'Contracts', and 'Admin'. The main content area is a form titled 'CONTRACT EXPRESS' with sections for 'First Party' and 'Second Party'. Each section asks for the company name, city/province, and the person signing on behalf of the company. There are also radio buttons for disclosing confidential information.

Our bespoke workflow tools and portals are custom designed to a client's unique parameters. We provide validation at every step in the process and high-level visualizations from any data stored in the tool. These bespoke tools can also act as the "glue" between clients' systems and other external tools to create a seamless, user-friendly and unified one-stop-shop for clients.
