Client portals

Our client portals are built using HighQ Collaborate to create secure and highly customizable cloud-based platforms to work more collaboratively with clients. Our client portals are bilingual and offer file sharing, collaboration, project and task management solutions. They are accessible on the go, with mobile and tablet optimization.

Key benefits

- Improves efficiency of project delivery by facilitating collaboration between teams

- Creates a single source of truth where all documents are stored, tracked and progressed in one secure place

- Enhances reporting on tasks and project progress due to structured data collection

- Designs, easily and rapidly, tailor-made collaboration portals based on client needs

Features

Files: This module allows you to share documents with anyone you allow access to the platform. Sensitive documents can be protected with digital rights management allowing you to restrict saving and printing, and apply watermarks.

iSheets: This module allows you track data in a database similar to Excel with additional capabilities to allow you to view the data in different ways. You are also able to design a dynamic questionnaire, enabling you to populate the database with structured data to be later used for visualisations and document automation.
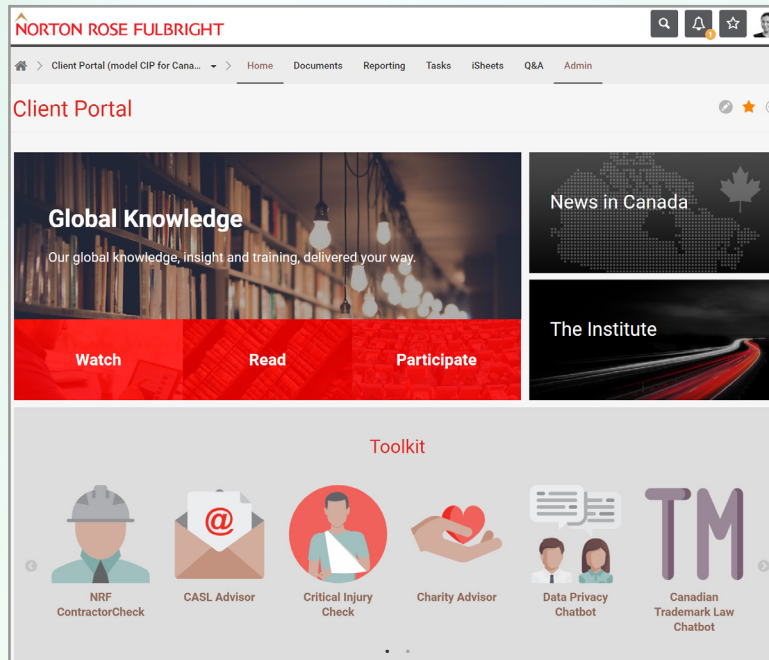

Tasks: The tasks module enables you to view the progress of projects, assign tasks to others, and add due dates, statuses, priorities, links, comments, and reminders all in the one place.

Wiki: This module allows you to post guidance and knowledge within the platform in a similar format to Wikipedia. Often this is used to guide members on aspects of the project.

Technical architecture/certifications

HighQ Collaborate is trusted by many of the world's leading law firms, financial institutions, life science organisations, corporations, and government entities to securely exchange highly sensitive information. HighQ is ISO27001 compliant. HighQ is a cloud hosted solution with data servers located in the U.K.

Examples of use cases

Use case: On-line Library

For our long-term institutional clients, HighQ has been used to organize legal content the firm has prepared for the client over the length of our relationship. Access can be restricted by legal team if required. In this manner, clients can always access the legal opinion work for which we have been retained, as well as key corporate documents, legal submissions and decisions.

Use case: Corporate Governance Review

HighQ's iSheets module can be used to collect data from various individuals throughout the organization in order to help our clients assess their corporate governance stance. The detailed permission levels allow you to keep all information collected in iSheets completely confidential. The data collected can later be used for document automation and data visualisation.
